

Naming Conventions for Chemical Compounds

I. Ionic compounds (metal + nonmetal(s))

A. monoatomic anion with singly-charged cation

[can tell charges by group or family on periodic table]

NaCl = sodium chloride

K₂S = potassium sulfide

B. monoatomic anion with multiply-charged cation

[Cr, Mn, Co, Fe, Cu, Ni, Au, Hg, Sn, Pb]

SnO = tin (II) oxide or stannous oxide

SnO₂ = tin (IV) oxide or stannic oxide

Fe₂O₃ = iron (III) oxide or ferric oxide

C. polyatomic anion [-ate has one more oxygen than -ite]

Na₂SO₄ = sodium sulfate

Na₂SO₃ = sodium sulfite

NaOH = sodium hydroxide

NaHCO₃ = sodium hydrogen carbonate (or sodium bicarbonate)

KMnO₄ = potassium permanganate

D. polyatomic cation [H₃O⁺, NH₄⁺]

NH₄Cl = ammonium chloride

(NH₄)₃PO₄ = ammonium phosphate

II. Molecular compounds (all nonmetals)

[use Greek prefixes except if only one of first element]

CO = carbon monoxide

CO₂ = carbon dioxide

Cl₂O₇ = dichlorine heptaoxide

III. Acids (has an H in front)

A. Binary acids

HCl(aq) = hydrochloric acid

HI(aq) = hydroiodic acid

H₂S(aq) = hydrosulfuric acid

B. Ternary oxyacids

H₂SO₄ = sulfuric acid (from sulfate, SO₄⁻²)

H₂SO₃ = sulfurous acid (from sulfite, SO₃⁻²)

HClO₄ = perchloric acid (from perchlorate, ClO₄⁻)

HClO₃ = chloric acid (from chlorate, ClO₃⁻)

HClO₂ = chlorous acid (from chlorite, ClO₂⁻)

HOCl = hypochlorous acid (from hypochlorite, ClO⁻)

HC₂H₃O₂ = acetic acid (from acetate, C₂H₃O₂⁻¹)
